

# Report 2020 on plant biodiversity in Italy: native and alien vascular flora

Fabrizio Bartolucci<sup>1</sup>, Gabriele Galasso<sup>2\*</sup>, Lorenzo Peruzzi<sup>3</sup>, Fabio Conti<sup>1</sup>

**Abstract** - This paper provides an updated overview, based on nomenclatural, taxonomical and distribution data, on the native and alien vascular flora of Italy, with details on the occurrence at national and regional administrative level. Recently described taxa occurring in Italy, which were not included in the checklists published in 2018, are listed. The list of extinct or possibly extinct native taxa and that of alien taxa of EU concern are updated.

**Key words:** checklist, endemism, extinction, Mediterranean flora, nomenclature, taxonomy.

**Riassunto** - Rapporto 2020 sulla biodiversità vegetale in Italia: flora vascolare autoctona e alloctona.

Viene presentato un rapporto sulla flora vascolare autoctona e alloctona del territorio italiano basato sugli ultimi aggiornamenti nomenclaturali, tassonomici e distributivi. Vengono forniti i numeri di dettaglio sulle presenze a livello nazionale e regionale. Inoltre sono elencati i taxa nuovi per la scienza presenti in Italia e non inclusi nelle checklist pubblicate nel 2018. Viene infine aggiornato l'elenco nazionale delle entità autoctone estinte o probabilmente estinte e delle entità aliene invasive di interesse unionale.

**Parole chiave:** checklist, endemismo, estinzione, flora mediterranea, nomenclatura, tassonomia.

## INTRODUCTION

After the publication of the two checklists of the native and alien vascular flora of Italy (Bartolucci *et al.*, 2018a;

Galasso *et al.*, 2018a), several floristic, systematic and taxonomic studies were published. Most of the new floristic records (based on herbarium specimens kept in Natural History Museum of Florence -FI- and in other public herbaria) concerning the distribution of the Italian vascular flora are published in the series “Notulae to the Italian native vascular Flora” (Bartolucci *et al.*, 2018b, 2018c, 2019a, 2019b, 2020a, 2020b) and “Notulae to the Italian alien vascular Flora” (Galasso *et al.*, 2018b, 2018c, 2019a, 2019b, 2020b, 2020c). These series also include nomenclatural, taxonomical and distribution updates published elsewhere, and corrigenda to the published checklists (as supplementary material). After the publication of the checklists, the data were organized into the information system “FlorItaly - Portal to the Flora of Italy” (Galasso *et al.*, 2020a; Martellos *et al.*, 2020), which is accessible online at the address <http://dryades.units.it/floritaly>. FlorItaly is updated every six months with data coming from the Notulae.

The aim of this contribution is to provide an updated overview on systematics, taxonomy and distribution (at national and administrative regional level) of the native and alien vascular flora of Italy, ca. three years after the publication of the Italian checklists.

## MATERIAL AND METHODS

The circumscription of families follows Bartolucci *et al.* (2018a) and Galasso *et al.* (2018a). The data also include apomictic taxa belonging to *Alchemilla* and *Rubus* (Rosaceae), *Hieracium*, *Pilosella*, and *Taraxacum* (Asteraceae), and the *Ranunculus auricomus* group (Ranunculaceae). Taxa at varietal rank were not considered. Hybrids are included only for the alien vascular flora. For Italian endemic taxa, we referred to the inventory proposed by Peruzzi *et al.* (2014), which is continuously updated (see <http://goo.gl/x8QL4J>), and to Bartolucci *et al.* (2018a). Following these authors, the “Italian endemic” status was attributed to those that occur only in Italy, or in Italy and Corse (France), or in Italy and Malta.

The distribution is given as presence/absence in each of the 20 administrative regions of Italy (not considering the two enclave-countries Republic of San Marino and Vatican City State), which are coded as follows: Valle d’Aosta, VDA; Piemonte, PIE; Lombardia, LOM; Trentino-Alto Adige, TAA; Veneto, VEN; Friuli Venezia Giulia, FVG; Liguria, LIG; Emilia-Romagna, EMR; Toscana,

TOS; Marche, MAR; Umbria, UMB; Lazio, LAZ; Abruzzo, ABR; Molise, MOL; Puglia, PUG; Campania, CAM; Basilicata, BAS; Calabria, CAL; Sicilia, SIC; Sardegna, SAR. For each region, the occurrence status of each taxon is provided, according the categories proposed by Bartolucci *et al.* (2018a) and Galasso *et al.* (2018a).

## RESULTS

To date (end of 2020, FlorItaly version 2020.2), the Italian native and alien vascular flora consists of 9,897 taxa (including casual alien plants), belonging to 1,547 genera and 198 families (Tab. 1).

Tab. 1 - Number of native and alien taxa occurring in each of the 20 administrative regions in 2020. Native: N+C (native + cryptogenic); N+C+A REG [NAT, INV] (native + cryptogenic + regionally non-native [naturalized, invasive]); N+C+A REG [CAS, NAT, INV] (native + cryptogenic + regionally non-native [casual, naturalized, invasive]); Alien: ARC (archaeophyte, casual aliens included); NEO (neophyte, casual aliens included); ARC ESTABL. (archaeophyte, casual aliens excluded); NEO ESTABL. (neophyte, casual aliens excluded). / Numero dei taxa nativi e alieni presenti nel 2020 in ognuna delle 20 regioni amministrative. Nativi: N+C (nativi + criptogenici); N+C+A REG [NAT, INV] (nativi + criptogenici + alieni regionali [naturalizzati, invasivi]); N+C+A REG [CAS, NAT, INV] (nativi + criptogenici + alieni regionali [casuali, naturalizzati, invasivi]); Alieni: ARC (archeofite, inclusi gli alieni casuali); NEO (neofite, inclusi gli alieni casuali); ARC ESTABL. (archeofite, esclusi gli alieni casuali); NEO ESTABL. (neofite, esclusi gli alieni casuali).

NUMBER OF TAXA (2020)

The native vascular flora consists of 8,237 taxa (6,461 species and 1,776 subspecies) belonging to 1,103 genera and 153 families. The most represented families ( $\geq 50$  taxa) and genera ( $\geq 40$  taxa) are reported in Table 2. The taxa endemic to Italy are 1,727, grouped in 318 genera and 70 families (Tabs. 3, 4). Among them, the taxa certainly occurring in Italy are 1,594 (P), while 119 taxa have not been confirmed in recent times (NC), 1 is doubtfully occurring (*Paeonia corsica* Sieber ex Tausch, occurring in Corse and doubtfully in Sardegna, D) and 13 are considered extinct or possibly extinct (EX) (Tabs. 4, 7). Four genera are narrowly endemic to Italy: *Eokochia* (Chenopodiaceae), *Rhizobotrya* (Brassicaceae), *Petagnaea*, and

Tab. 2 - Most represented families of the Italian vascular flora in 2020: Native: ( $\geq 50$  taxa) and genera ( $\geq 40$  taxa); Alien: ( $\geq 25$  taxa) and genera ( $\geq 10$  taxa). / Famiglie (Native:  $\geq 50$  taxa; Alienie:  $\geq 25$  taxa) e generi (Nativi:  $\geq 40$  taxa; Alieni:  $\geq 10$  taxa) maggiormente rappresentati nel 2020 nella flora vascolare italiana.

*Siculosciadium* (Apiaceae). Three genera are endemic to Sardegna and Corse (France): *Morisia* (Brassicaceae), *Castroviejoa*, and *Nananthea* (Asteraceae). The most represented families ( $\geq 20$  taxa) and genera ( $\geq 15$  taxa) concerning Italian endemics are reported in Table 3. The administrative regions showing the highest number of Italian endemics (Tab. 5), are: SIC (424), SAR (319), CAL (300), ABR (299), BAS (240), and TOS (227). The native taxa certainly occurring in Italy are 7,528 (P), while 564 taxa have not been confirmed in recent times (NC), 99 are doubtfully occurring (D), and 18 are data deficient (DD) (Tabs. 6, 10). Out of the not confirmed taxa, 28 are considered extinct or possibly extinct (Tab. 7, Fig. 1). In

addition, the taxa recorded by mistake at national level are 195. The administrative regions with the highest number of native taxa (Tab. 1), also considering the regionally non-native (casual, CAS; naturalized, NAT; invasive, INV) taxa, are: PIE (3,554), TAA (3,506), TOS (3,458), LOM (3,452), VEN (3,360), and ABR (3,235). By excluding the regionally non-native taxa (CAS, NAT, INV), the regions with the highest number of taxa are: PIE (3,479), TOS (3,424), LOM (3,286), ABR (3,206), VEN (3,181), and TAA (3,119). Cryptogenic taxa are 56, while 433 taxa are taxonomically doubtful (Tabs. 6, 10). The increase in the number of taxa from 2018 at regional level is showed in Table 12.

		<i>Pilosella</i>	15

The alien vascular flora consists of 1,660 taxa (1,574 species, 32 subspecies, and 54 hybrids), i.e. 16.16% of the total Italian flora, belonging to 741 genera and 154 families. The most represented families ( $\geq 25$  taxa) and genera ( $\geq 10$  taxa) are reported in Table 2. The taxa currently established (NAT + INV) in Italy are 820 (593 NAT and 227 INV), while 744 are casual (CAS), 3 are not assessed (CAS?, possibly casual), 5 are data deficient (DD A, unknown regional distribution, possibly casual), 48 have not been confirmed in recent times (NCA), 3 are possibly (locally) extinct (*Plantago patagonica* Jacq., *Sagittaria platyphylla* (Engelm.) J.G.Sm., and *Themeda triandra* Forssk.), and 37 are doubtfully occurring in the country (D A) (Tabs. 8, 10). The number of taxa recorded by mistake (NP) is 99 (Tab. 10). Looking at the taxa involved in past domestication processes, 107 taxa are culta, 54 are ferals, while 1 additional taxon is regarded as doubtfully culton. The Italian alien flora includes 1,500 neophytes and 160 archaeophytes (Tab. 1). Twenty alien species of EU concern (Regulation (EU) 1143/2014 concerning Invasive Alien Species, Commission Implementing Regulations (EU) 2016/1141, 2017/1263 and 2019/1262) occur in Italy, of which 16 are invasive at national level, 3 are considered as naturalized, while 1 is not confirmed in recent times (Tab. 9). The administrative regions with the highest number of alien taxa are LOM (790, of which 366 established), TOS (644, of which 282 established), VEN (643, of which 257 established), TAA (592, of which 179 established), EMR (547, of which 252 established), and PIE (547, of which 309 established) (Tab. 1). The increase in the number of taxa from 2018 at regional level is showed in Table 13.

## DISCUSSION

The native plants of Italy amount to 8,237 species and subspecies, including 56 cryptogenic taxa. This number consolidates the primacy in Europe already highlighted by Bartolucci *et al.* (2018a), Italy being the European country that hosts the highest number of native plants. The increase recorded since March 2018 (Bartolucci *et al.* 2018a) to December 2020 consists of 42 taxa (0.51%), with consistent variation among administrative regions (Tab. 12). Some have an increase rate greater than 1%, such as e.g. TOS (1.60%), BAS (1.35%), and LAZ

(1.16%). The increase at national level is mostly due to the 31 newly described taxa (including the validation of the name *Ulmus minor* subsp. *canescens* Bartolucci & Galasso), in most cases Italian endemics (Tab. 11). This increase documents the good state of floristic research in Italy. In 2018 (from March to December), 3 new vascular plants were described from Italy (e.g. Fig. 2B), 19 taxa in 2019, and 9 taxa in 2020 (e.g. Fig. 2A). Most of them belong to taxonomically critical genera such as *Epipactis* (5 species), *Genista* (1 species and 2 subspecies), *Hieracium* (3 subspecies), and *Rubus* (2 species).

Less comforting is the increase of alien taxa by 63 (+3.94%), which documents a rapid and worrying increase in allochthones, most significant being the increase of 23 new naturalized and 6 invasive aliens. In some administrative regions the increase is alarming (Tab. 13): +28.09% in CAL, +16.51% in FVG, +11.03% in TOS. These values are probably due to the intensification of exploration, however these are substantial changes, which deserve great attention.

The taxa not confirmed for Italy have slightly decreased, from 568 to 564. These taxa will be the object of a project undertaken by the working group for Floristics, Systematics and Evolution of the Italian Botanical Society, aimed at verifying their occurrence in Italy during the next few years. Unfortunately, the number of taxa considered extinct has slightly increased from 26 to 28, 13 of which are endemic to Italy (Tab. 7). Three taxa were newly reported as extinct in Italy [*Carex pediformis* C.A.Mey. subsp. *pediformis*; *Crepis mollis* (Jacq.) Asch. subsp. *mollis*; *Hieracium tolstoii* Fen. & Zahn, Fig. 1], while the taxonomic status of *Puccinellia gussonei* Parl. (extinct in Bartolucci *et al.* 2018a), was revised, being now considered as a synonym of *P. festuciformis* (Host) Parl. subsp. *lagascana* M.A.Juliá & J.M.Monts. (Bartolucci *et al.* 2020b; Abeli *et al.* 2021). The knowledge that will be acquired in the coming years will be crucial to better understand the conservation status of the Italian flora.
