

# Notes on *Longitarsus aphthonoides* Weise 1887 and on the species groups of *L. lateripunctatus* (Rosenhauer 1856) and *L. curtus* (Allard 1860) (Coleoptera, Chrysomelidae)

Laura Farina

**Abstract** - The aim of this study is to deepen the knowledge of five poorly studied *Longitarsus* species in order to elucidate their taxonomic position within the genus. For each of them further diagnostic characters and many new collecting localities are supplied.

One new synonymy and one change of status are proposed: *L. callidus* Warchałowski 1967 = *L. aphthonoides* Weise 1887 *syn. nov.*, and *L. lateripunctatus personatus* Weise 1893 is raised to valid species. The morphologically similar *L. curtus* (Allard 1860) and *L. monticola* Kutschera 1863 are also examined, providing new male and female diagnostic characters for their identification, as well as several European and Italian new collecting localities.

**Key words:** Alticinae, European fauna, Galerucinae, Italian fauna, Mediterranean fauna, taxonomy.

**Riassunto** - Note su *Longitarsus aphthonoides* Weise 1887 e sui gruppi di specie *L. lateripunctatus* (Rosenhauer 1856) e *L. curtus* (Allard 1860) (Coleoptera, Chrysomelidae).

Scopo di questo studio è approfondire la conoscenza di cinque specie di *Longitarsus* scarsamente studiate al fine di chiarire la loro posizione tassonomica all'interno del genere. Per ciascuna di esse vengono forniti ulteriori caratteri anatomici comparativi e numerosi nuovi dati geonomici.

Vengono proposti una nuova sinonimia: *L. callidus* Warchałowski 1967 = *L. aphthonoides* Weise 1887 *syn. nov.* e il cambio di stato di *L. lateripunctatus personatus* Weise 1893 che è elevato a rango di specie. Per *L. curtus* (Allard 1860) e *L. monticola* Kutschera 1863, specie assai simili, vengono forniti nuovi caratteri diagnostici, sia maschili che femminili, e numerose nuove località europee e italiane.

**Parole chiave:** Alticinae, fauna europea, fauna italiana, fauna mediterranea, Galerucinae, tassonomia.

## INTRODUCTION

*Longitarsus* Latreille 1829 (2: 155) (*sensu* Löbl & Smetana, 2010) is the world's largest genus of Alticinae, with about 500 species described. About 150 species are known for the Palaearctic Region, including 93 species

Online publication: 29 October 2021

for Italy only: see Biondi *et al.* (1995), with the addition of *L. anacardius* (Allard 1866) *sensu* Leonardi & Sassi (1997).

The aim of this paper is to provide new diagnostic characters to clarify the related taxonomy of five species of *Longitarsus*, and to extend the knowledge of their ranges by listing new collecting localities. The following taxa are discussed:

*Longitarsus aphthonoides* Weise 1887  
*Longitarsus callidus* Warchałowski 1967  
*Longitarsus lateripunctatus* (Rosenhauer 1856)  
*Longitarsus personatus* Weise 1893  
*Longitarsus curtus* (Allard 1860)  
*Longitarsus monticola* Kutschera 1863

## MATERIALS AND METHODS

All observations were done using binocular microscopes. To set specimens and genitalia on the label, the author first gets the specimen wet, after boiling in pure water; then extracts genitalia with the aid of two pins. For the *spermatheca* extraction usually it is necessary to cut completely the abdomen of the wet specimen, separating it from the rest of the body, and extract gently the *spermatheca*. For the *aedeagus* extraction, instead, the author cuts slightly the abdomen in the middle and extracts carefully the *aedeagus*. The *aedeagi* and *spermathecae* were fixed with Arabic gum and set on the same label of the specimen or on another label below. The *spermathecae* were included in DMHF (Dimethyl-hydantoin formaldehyde) or in entomological glue. The biometric measurements were taken using an ocular micrometer. Drawings were taken using an eyepiece equipped with a 20x20 reticule and manually transferring the observed image on graph paper. The length of elytra and prothorax were measured keeping the specimens tilted in order to have the base and the apex of the elytra (or the fore and the rear edge of pronotum) on the same plane (Farina & Leonardi, 2018). The macrophotos were taken using a full-frame digital camera with a 25 mm lens.

Collection localities were recorded as written on the specimens' labels. Countries and Italian regions were arranged in a west to east and north to south order; the localities were listed grouping them according to the region of provenance and museum or private collections.

The specimens included in this study are kept in the following institutional and private collections:  
 BMNH: Natural History Museum, London (BMNH-War: A. Warchalowski collection);  
 CGCB: Christoph Germann collection, Basel, Switzerland;  
 DFCA: David Furth collection, Alexandria, VA, USA;  
 FFCJ: Frank Fritzlar collection, Jena, Germany;  
 FMCT: Fernando Montemurro collection, Taranto, Italy;  
 HNHM: Hungarian Natural History Museum, Budapest;  
 LFCC: Laura Farina collection, Casatenovo, Lecco, Italy;  
 MBCA: Maurizio Biondi collection, University of L'Aquila, Italy;  
 MHNB: Naturhistorisches Museum, Basel (MHNB-Heik: 1953 F. Heikertinger collection);  
 MSNG: Museo Civico di Storia Naturale "G. Doria", Genova (MSNG-Bin: G. Binaghi collection; MSNG-Dod: A. Dodero collection; MSNG-Man: C. Mancini collection);  
 MSNM: Museo di Storia Naturale di Milano (MSNM-Ber: M. Bergeal collection);  
 MSNVR: Museo Civico di Storia Naturale, Verona;  
 NHMW: Naturhistorisches Museum, Wien;  
 RPCR: Riccardo Papi collection, Ragusa, Italy;  
 SDEI: Senckenberg Deutsches Entomologisches Institut, Müncheberg;  
 SZCM: Stefano Zoia collection, Milano, Italy;  
 ZMB: Museum für Naturkunde, Berlin;  
 ZSM: Zoologische Staatssammlung München.

### **Further abbreviations**

Al: median lobe of *aedeagus* length (taken in ventral view);  
 Aw: median lobe of *aedeagus* width (taken in ventral view);  
 El: elytral length;  
 Ew: elytral width (taken together);  
 Ig: lateral groove;  
 Lt: length of hind tibia in stretched position;  
 mg: median groove;  
 (...m: mean value of...;)  
 n: number of specimens in the sample;  
 Pl: prothorax length;  
 Pw: prothorax width;  
 (!): specimens dissected for genitalia examination;  
 /: line break within the label; the line break is not applied in the species determination labels.  
 //: next label on the same pin.

### **SPECIES DISCUSSION**

#### *Longitarsus aphthonoides* Weise 1887 (Figs. 1-3)

*Longitarsus aphthonoides* Weise, 1887: 206. Reported locality: Chabarofka.

Heikertinger, 1930: 1326; Csiki & Heikertinger, 1940: pars 166, 110; Lopatin, 1967: 166; Warchalowski, 1970: 106-107, 114 (Fig. 5) [designation of the Lectotype, typ. loc.: Ussuri Gebiet, Chabarofka]; Gruev, 1980: 32; Gruev, 1981: 149; Medvedev, 1982: 114-115 (Fig. 34: 2); Gruev, 1987: 56 (Fig. 3); Medvedev & Dubeshko, 1992: 153, 216

= *Longitarsus callidus* Warchalowski, 1967: 59-60. Loc. typ.: North Iran: Mt. Talysch (*syn. nov.*)

Leonardi, 1975: 207 (Figs. 27-28, 53), 212 (Fig. 57), 213-214; Fogato & Leonardi, 1980: 46, 53 (Fig. 14); Doguet, 1987: 4(2): 138; Biondi, 1990a: 138; Döberl, 1994: 103, 129 (Figs. 173-175); Doguet, 1994: 224 (Fig. 93f), 228-229, 297 (Fig. 122b); Lucht, 1994: 319; Doguet & Dufay, 1994: 306-307 (Figs. 5, 7); Biondi *et al.*, 1995: 18; Döberl, 1995b: 53; Warchalowski, 1995a: 152 (Figs. 460-461), 155 (Fig. 478), 224; Warchalowski, 1996: 45 (Fig. 95-96), 48 (Fig. 113), 76-77; Rozner, 1996: 255 ["this species is distributed from Asia Minor through Southeast Europe to Austria. Its occurrence in Hungary is quite probably"]; Gruev & Döberl, 1997: 157-158; Geiser, 2001: 465; Brelih *et al.*, 2003: 96; Warchalowski, 2003: 419; Geiser, 2004: 19; Biondi, 2005: data on CD-Rom; Gruev & Döberl, 2005: 80; Čížek, 2006: 24-25; Warchalowski, 2010: 841 (Figs. 4096-4097), 842 (Fig. 4098); Özdi̇kmen *et al.*, 2020: 282.

### **Types**

Lectotype (♂) and paralectotype (♀) of *L. aphthonoides* (Chabarofka, leg. Koltze, undated), selected and studied by Warchalowski (1970: 106-107) were not retrieved (see below under "Notes on types search and identification").

Two of the 5 paralectotypes (still labelled as syntypes) of the Koltze collection, housed at SDEI, were seen as a detailed photograph (kindly supplied by Lutz Behne) (Fig. 2):

2 exx., labelled "Chabarofka // Weise", undated. A second handwritten label (by Weise, Koltze or else): "12223, *aphthonoides* Ws, Chabarofka Weise determ. Type".

Three specimens previously thought to be syntypes of *L. aphthonoides* and now redefined as paralectotypes were found and examined:

1 ♀! labelled "Cotype" in MHNB: "Chabarowka / *aphthonoides* Weise det. / Reitter don. // 1953 Coll. Heikertinger // *Paralectotypus* / *Longitarsus aphthonoides* Weise / *vidit* Laura Farina".

1 ex. in HNHM labelled "Chabarowka / *Longitarsus aphthonoides* Weise coll. Reitter // *Paralectotypus* / *Longitarsus aphthonoides* Weise / *vidit* Laura Farina".

1 ex. in ZMB labelled "Chabarowka / coll. Koltze // *Typus* // *Longitarsus aphthonoides* Weise det. L. N. Medvedev, 1987 // *Paralectotypus* / *Longitarsus aphthonoides* Weise / *vidit* Laura Farina".

The holotype of *L. callidus*, kept at BMNH was kindly sent by Maxwell Barclay (Fig. 3: *Holotypus*; Fig. 4: *aedeagus*):

1 ♂! labelled "Talysch / Reitter // *Longitarsus / callidus mihi* / det. A. Warchalowski // *Holotypus* // BMNH / A. Warchalowski collection".

The study of this material (plus the many specimens listed below) did not leave any doubt about the synonymy proposed here:

*Longitarsus aphthonoides* Weise 1887 = *Longitarsus callidus* Warchalowski 1967 *syn. nov.*

## Distribution

*L. aphthonoides* is widely distributed in the Palaearctic region, west from Italy and Tunisia across Asia, east to the Siberian Far East.

Gruev & Döberl (1997: 148, 157-158; 2005: 75, 80) report the following regions:

**Europe:** Austria, Azerbaijan (Dashdatuk), Carpathian Basin, Czechia (Moravia), France, Germany (West), Hungary, Italy (North), Poland, Slovakia, Slovenia (Veržej-Gomilica), Switzerland.

**Asia:** China (Heilungkiang, Fukien: Kuatun), Evenkia, Iran (North), Kazakhstan ("Aulie Ata" = Dzhambul; Syr Daria Valley; "Werneyi" = Alma Ata), Korea, Kurils, Mongolia, Russia (Mid Siberia, Irkutsk District, East Siberia, Far East, Amurland, Maritime Province), Sakhalin, Turkey.

**North Africa:** Tunisia.

## Morphological remarks

*L. aphthonoides* belongs to the group of *L. membranaceus* (Foudras 1860) (Leonardi, 1975: 213-214; Doguet & Dufay, 1994: 306-307; Warchałowski, 1970: 106-107; 1995: 224); as for *habitus*, it is similar to *L. lycopi* (Foudras 1860) (Warchałowski, 1970: 106-107; Leonardi, 1975: 213-214).

After many years from the Weise paper dealing with *L. aphthonoides*, and taking into account that the Warchałowski description (1967: 59-60) of his *L. callidus* might be considered rather short, it is useful to provide a new description of this taxon.

Body length: ♂♂: 1.36-1.68 mm, ♀♀: 1.58-1.91 mm.

Shape elliptical, moderately narrow and on average elongate (Figs. 1-3). Upper side (in mature individuals) yellow to pale rusty-brownish; elytral suture lightly darkened; head usually brown, darker than pronotum; upper lip dark.

*Antennae* pale at least in part: in some specimens progressively darkened from 5°-6° antennomeres, at times the last 4-5 antennomeres blackish. Legs yellow, hind femora often dark but rarely completely pale (as yellow as body); in some specimens, also last tarsomere and claws dark.

*Frons* ['postfrons' sensu Heikertinger, 1913 (Fig. 5)] and vertex [sensu Doguet, 2004 (Fig. 5a)] entirely microgranulated. Frontal tubercles distinctly separate from *frons* by deep frontal furrows. Ocular furrows weak and incomplete in terminal part as in *L. lycopi*.

*Antennae* always shorter than body. Articles ratio: 16:9:8:9:11:9:11:12:10:14.

*Pronotum* transverse [(Pw/Pl)m= 1.57-1.61], convex, wider in middle; sides rounded, lateral calli (behind fore corners) often showing an angular or obtuse dentiform profile; surface clearly microgranulated and rather strongly punctate; posterior angle, in intact specimens, with an erect seta as long as last antennomere.

*Elytrae* bright, moderately elongated [(El/Ew)m = 1.56-1.57], slightly rounded on sides, jointly rounded apically; surface less microgranulated than *pronotum* and more strongly, irregularly punctate, sometimes with traces of alignment. Humeral calli usually absent or weak but rather developed on approximately 30% of the examined specimens.

*Pigidium* microgranulated, covered by seta punctation, finely punctate in apical half and simply microgranulated basally.

Male last sternite with a deep, oval pit (Warchałowski, 1967: 59 Fig. 3B; Leonardi, 1973: 212 Fig. 57).

First tarsomere of fore legs clearly widened in male (Warchałowski, 1967: 59 Fig. 3A; Leonardi, 1973: 207 Fig. 43).

Median lobe of *aedeagus* (Figs. 4, 9-10), in lateral view, almost straight in distal part but, sometimes, distal 2/3s weakly curved with apex shortly sinuate and apical tip always facing upwards [a character which does not appear in the Warchałowski drawings: both *L. aphthonoides* (Warchałowski, 1970: 114 Fig. 5) and *L. callidus* (Warchałowski, 1967: 59 Fig. 3C), but appears in the Medvedev drawing of *L. aphthonoides* (Medvedev, 1982: 114-115 Fig. 34: 2)]; in ventral-dorsal view its distal 1/3 tapered and rather expanded at apex with apical tip rather short and prominent. Ventral groove moderately deep, widened, its bottom with slight transverse wrinkles.

Basal part of *spermatheca* (Figs. 11-12) more or less kidney-shaped, basal and distal part well differentiated from each other, tip of distal part usually absent; *ductus spermathecae* forming one, more or less widened, loop; *ductus* insertion about in the middle of *spermatheca* basal part.

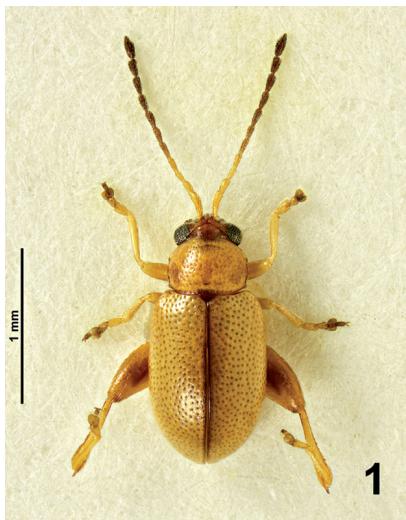

Morphological data. – ♂ (n=8): El = 1.05-1.26 mm; (El)m = 1.17 mm; Ew = 0.70-0.79 mm; (Ew)m = 0.75 mm; Pl = 0.29-0.35 mm; (Pl)m = 0.31 mm; Pw = 0.47-0.54 mm; (Pw)m = 0.50 mm; Lt = 0.44-0.54 mm; (Lt)m = 0.50 mm; El/Ew = 1.48-1.61; (El/Ew)m = 1.56; El/Pl = 3.40-4.20; (El/Pl)m = 3.77; Pw/Pl = 1.40-1.70; (Pw/Pl)m = 1.61; Lt/El = 0.41-0.46; (Lt/El)m = 0.43.

♀ (n=11): El = 1.21-1.37 mm; (El)m = 1.29 mm; Ew = 0.77-0.91 mm; (Ew)m = 0.82 mm; Pl = 0.28-0.40 mm; (Pl)m = 0.35 mm; Pw = 0.51-0.58 mm; (Pw)m = 0.55 mm; Lt = 0.47-0.58 mm; (Lt)m = 0.52 mm; El/Ew = 1.48-1.66; (El/Ew)m = 1.57; El/Pl = 3.38-4.03; (El/Pl)m = 3.69; Pw/Pl = 1.40-1.86; (Pw/Pl)m = 1.57; Lt/El = 0.35-0.43; (Lt/El)m = 0.40.

As mentioned above, the study of the *L. callidus* holotype has not shown any meaningful difference from the paralectotypes of *L. aphthonoides* and other specimens including topotypes. It's worth noting that the author could not corroborate the ♂♂ differences (between specimens determined *L. callidus* and *L. aphthonoides*) in the *aedeagus* shape, antennal length (which are shorter than the body in the specimens studied), male width first tarsomere of fore tarsi (which is medium to strong) and the last sternite character (with a deep, oval pit), previously reported by Warchałowski (1967: 59, 60; 1970: 106-107, 114 Fig. 5) and Leonardi (1975: 213-214).

In conclusion, the synonymy between the two names is here proposed.

It should be added that also Leonardi (1975: 213-214) already reported the similarity between *L. callidus* Warchałowski and *L. aphthonoides* Weise, as based on the study of only a few ♀♀ specimens (including one syntype) of *L. aphthonoides* from the Frey collection (housed at MHN). The same author indeed noted the closeness between the two in both external characters and the *sper-*

*matheca* shape, not advancing the synonymy because of the Warchałowski (1967: 59, 60; 1970: 106-107, 114 Fig. 5) claim of the several differences in the ♂♂ between these two species.

### Notes on typical locality

The exact placement of the *L. aphthonoides* type locality deserves a clarification.

Weise (1887: 206), in his original description, simply reported "Chabarofka". Warchałowski (1970: 106-107) identified a specimen from this locality as lectotype and correctly placed "Chabarowka" in the "Ussuri-Gebiet" (= Ussuri region).

Today, the place can be identified with Khabarovsk (also spelled Chabarovsk or Khabarovka; Chabarofka in German), a town and an administrative territory of the Russian Far East located at the confluence of Amur and Ussuri rivers.

### Notes on ecology

In Italy *L. aphthonoides* was observed in May-June 1973, close to Rovasenda (Vercelli, Piedmont), on *Lysimachia vulgaris* L. (Primulaceae), but probably this was only a refuge plant (Leonardi, 1975: 213-214, reported as *L. callidus*). The host plant could be *Stachys* L. spp. or *Teucrium* L. spp. (Lamiaceae), similarly to other species related to *L. membranaceus*.

*L. aphthonoides* was also observed on *Sanguisorba officinalis* L. (Rosaceae) (Warchałowski, 1996: 76-77) and on *Onobrychis viciifolia* Scopoli (= *Onobrychis sativa* Lamarck) (Fabaceae) (Özdikmen et al., 2020: 282).

In the Rovasenda area, *Lysimachia vulgaris* as well as the (supposed) host plants (*Stachys* spp., *Teucrium* spp., *Sanguisorba officinalis*) are rather common and widespread but, unfortunately, this species could not be observed any more in the several surveys carried out by the author in the years 2018, 2019 and 2020.

### Notes on types search and identification

Warchałowski (1970: 106-107) established, as lectotype (♂) and paralectotype (♀) of *L. aphthonoides*, two specimens of "DEI" collection in Eberswalde (now SDEI in Müncheberg), from Chabarofka, leg. Koltze, undated.

Unfortunately, it was impossible to examine these specimens. Indeed, they are missing from the type series still present in SDEI, they are missing in the collection Warchałowski housed at the BMNH and they were not found also in the Reitter collection (housed both at MH-NB and HNHM).

At ZMB, two specimens were found, bearing a red label "Typus", written by a curator (Bernd Jaeger *in verbis*); one of these specimens (♀) not dissected and labelled "Chabarowka / Koltze // det. Medvedev 1987", is probably a syntype of Weise, now a paralectotype. The other specimen, a male, not dissected, is labelled Irkutsk and collected by Koltze (but it cannot be considered among the type material).

Some topotypical specimens were also found in the MSNM-Ber, permitting to illustrate the median lobe of the *aedeagus* of one of them (Fig. 9).

### Materials studied

As mentioned, many specimens were studied, from several Western and Eastern Palaearctic localities (as detailed below), which were determined with either one or the other name but all certainly belonging to this same species.

**Italy:** Piemonte: **2 exx.** (1♂! 1♀!) Rovasenda / 13.V.1973 / leg. Leonardi // *Longitarsus callidus* det. C. Leonardi (LFCC); **3 exx.** Rovasenda / 17.VI.1973 / leg. Leonardi // *Longitarsus callidus* det. C. Leonardi (LFCC); **1 ex.** (1♂!) Rovasenda / 17.VI.1973 / leg. Leonardi // *Longitarsus callidus* Warchałowski det. C. Die Normalform *lateripunctatus* (*biguttatus* Foudras) nur in Mittelmeergebiete”]; Müller, 1949-1953: 524, 536; Kaszab, 1962: 311 (Fig. 132 I-J), 314; Gruev, 1979: 131; Biondi, 1990a: 142-143; Biondi, 1990c: 346; Gruev et al., 1993: 102; Döberl, 1994: 107, 135 (Figs. 266-268); Doguet, 1994: 220-221, 260 (Fig. 105bis b), 297 (Fig. 122g); Lucht, 1994: 319; Döberl, 1995b: 55-56; Warchałowski, 1995a: 144 (Fig. 384), 146 (Figs. 400-401), 254-256 (Figs. 954, 956); Warchałowski, 1996: 36 (Fig. 19, *L. lateripunctatus*), 38 (Figs. 35, 36, *L. lateripunctatus*), 137-138, 141 (Fig. 589), 142 (Fig. 591); Vig, 1996: 125; Rozner, 1996: 256; Strejcek, 1996: 572; Gruev & Tomov, 1998: 93; Gruev & Döberl, 1997:182; Herger & Kamke, 1998: 123 [“neu für Kanton Schaffhausen und NordSchweiz”]; Callot, 1999: 43; Gruev, 2002: 27; Vig, 2002: 122; Brelih et al., 2003: 114; Geiser, 2004: 19; Gruev & Döberl, 2005: 90; Čížek, 2006: 32 (Fig. 102)-33; Warchałowski, 2010: 864 (Figs. 4289-4290), 865 (Fig. 4292); Baviera & Biondi, 2015: 19; Fritzlar, 2017: 80.

= *Longitarsus lateripunctatus* (Rosenhauer 1856)

Furth, 1980: 101 [partim?]

The comparative study of a wide sample (MSNM, MSNG, MHNB, HNHM and private collections) permitted to come to the conclusion that *L. personatus* is neither just a wingless form of *L. lateripunctatus*, as Weise supposed (1893: 964) and as Warchałowski (1978: 49-50) and Gruev & Tomov (1986: 221-222) confirmed, nor a subspecies, as put forward by Heikertinger (1912: 194), Müller (1949-1953: 524, 536), Kaszab (1962: 311, 314), Doguet (1989: 172) and Warchałowski (1996: 137), but a valid species. This taxonomic proposal is based on the significant morphological differences between the two species and considers the partial overlap of their ranges (Fig. 31).

### Comparative description

An accurate morphological description of both species can be found in Doguet (1989: 172; 1994: 220-221, 260 Figs. 105 bis a, b) and Warchałowski (1995: 254-256; 1996: 137-138, 142 Figs. 590-591), which also report colour differences, regrettably not always a stable character. In addition, Doguet (1989: 172; 1994: 220-221, 297 Figs. 122 f-g) observed differences in the shape of the sper-

matheca (*ductus spermathecae* forms 2 or 3 loops in *L. lateripunctatus* and shows no loops in *L. personatus*). The comparative analysis of the morphology on a wider sample permitted to add further discriminant characters between the two species (Table 1).

### Distribution

*L. personatus* distribution is mainly eastern Euro-Mediterranean.

Gruev & Döberl (1997: 182; 2005: 90) report the following regions:

**Europe:** Austria, Bosnia-Herzegovina, Bulgaria, Carpathian Basin, Croatia, Czechia, France (Alsace), Germany, Greece (Crete), Hungary, Italy (North and East), Moldavia, Montenegro, Rumania, Serbia, Slovakia, Slovenia, Switzerland, Ukraine.

**Asia:** Caucasus, Cyprus, Greece (Rhodos), Israel, Caucasic Russia (Krasnodar District), Turkey.

In previous studies (Müller, 1949-1953: 524, 536; Doguet, 1989: 172; 1994: 220-221; Warchałowski, 1995a: 254-256; 1996: 137-138, 141; 2010: 865) where *L. lateripunctatus* and *L. personatus* were considered as geographical races of the same species, *L. lateripunctatus* was reported to include the western Mediterranean area, while *L. personatus* range would cover the northern and eastern part of it. However, as it appears from the materials studied (see below), the two species are clearly parapatric (Fig. 31), with overlapping ranges, which mainly include peninsular Italy and Sicily.

It is worth reporting that, at least in two instances, the two species were found together in the same locality:

San Pier Niceto, Messina, Sicilia:

*L. lateripunctatus*: 1 ex. San Pier Niceto (Leonardi in verbis)

*L. personatus*: 1 ex. (1♀!) (MSNM) labelled “Sicilia Messina Peloritani / San Pier Niceto 2, 350 m / 19.VI.2011 / leg. C. Baviera”

Lazio, Riano:

*L. lateripunctatus*: 1 ex. (1♂!) (MBCA) labelled “Lazio Roma / Riano Flaminio / 1.IV.1979 M. Biondi”

*L. personatus*: 1 ex. (1♀!) (MSNM) labelled “Lazio Riano / VII.1937 Garavaglia”

In other countries too, specimens of the two species were occasionally found in the same locality. For example, in Greece (Corfu):

*L. lateripunctatus*: 1 ex. (1♀!) (MHNB-Heik) labelled “Corfù / Valle di Ropa”, undated; 2 exx. (1♀!; 1♂!) (HNHM, the ♀ coll. Dr. J. Fodor) labelled “Corfù / Paganetti”, undated;

*L. personatus*: 2 exx. (1♀!; 1♂!) (MHNB-Heik) labelled “Corfù / Paganetti”, undated; 1 ex. (1♂!) (HNHM) labelled “Corfù / Paganetti”, undated.

### Materials studied

**France:** 1 ex. Gallia / Reitter (MSNM); 2 exx. Bois de Sermersheim / 9.IV.1999 M. Callot / Pulmonaria (MSNM-Ber);

**Italy:** Friuli Venezia Giulia: 1 ex. (1♂!) Trieste-Carso / Divaccia / 14.VI.2008 (MSNM) (Fig. 28); 1 ex. (1♀!) Trieste-Carso / Divaccia / 14.VI.2008 (MSNM);

Tab. 1 - Taxonomically discriminant characters of *L. lateripunctatus* and *L. personatus*. / Caratteri tassonomici discriminanti di *L. lateripunctatus* e *L. personatus*.

Character	<i>L. lateripunctatus</i> (Rosenhauer 1856)	<i>L. personatus</i> Weise 1893
Elytrae	Sutural stripe of <i>elytrae</i> almost parallel and usually narrow, in some specimens wider in middle (Fig. 6; also: Doguet, 1989: 172 Fig. 1; Warchałowski, 1996: 142 Fig. 590; Doguet, 1994: 260 Fig. 105bis a), never joining lateral black spots, except in one specimen from Morocco (prov. Taza in MBCA) which is considered belonging to <i>L. lateripunctatus</i> for the shape of the <i>aedeagus</i> .	Sutural stripe of <i>elytrae</i> widened before middle, sometimes joining lateral black spots (Fig. 5; also: Doguet, 1989: 172 Fig. 2; Warchałowski, 1996: 142 Fig. 591; Doguet, 1994: 260 Fig. 105bis b). Uncommonly pale specimens can be found, with sutural stripe narrower in material studied from Cyprus: 4 exx. (4♀! 4♂!) "Larnaka, Tochni", "Lemessos, Pachna", "Lemessos, Gerovasa", "Larnaka, Lefkara" (FFCJ) and 1 ex. (1♂!) "Akamas, Drouseia" (MSNM-Ber).
Spermatheca	<i>Ductus spermathecae</i> forms 2 or 3 loops (Figs. 13-17; also: Doguet, 1989: 172 Fig. 3; 1994: 297 Fig. 122f). Distal part of <i>spermatheca</i> usually wide and rounded at apex.	<i>Ductus spermathecae</i> more or less long and without loops (Figs. 18-22; also: Doguet, 1989: 172 Fig. 4; 1994: 297 Fig. 122g). In some specimens, <i>ductus</i> forms a slight ripple (Figs. 18 and 21). Distal part of <i>spermatheca</i> usually narrow and apically folded.
Median lobe of <i>aedeagus</i>	Median lobe of <i>aedeagus</i> (Figs. 23-26) on average less elongate than in <i>L. personatus</i> : (n=12) Al = 0.652-0.732 mm; (Al)m = 0.696 mm; Aw = 0.112-0.128 mm; (Aw)m = 0.122 mm; (Al/Aw) = 4.993-6.536; (Al/Aw)m = 5.732. In ventral view comparatively straight or basal 2/3s weakly tapered, not broadened at apex (only in a few specimens, weakly broadened); distal 2/3s usually bent in lateral view. Specimens from North Africa show a longer <i>aedeagus</i> in ventral view (Fig. 24a) basal 2/3s tapered and weakly wider at apex, but in lateral view bent as usual (Fig. 24b).	Median lobe of <i>aedeagus</i> (Figs. 27-30) more elongate than in <i>L. lateripunctatus</i> : (n=12) Al = 0.699-0.792 mm; (Al)m = 0.747 mm; Aw = 0.096-0.128 mm; (Aw)m = 0.115 mm; (Al/Aw) = 5.974-7.375; (Al/Aw)m = 6.539. In ventral view basal 2/3s weakly tapered and more or less broadened at apex. In lateral view distal 2/3s appear comparatively straight.
Wings	Usually hind wings well-developed, with humeral calli evident (75% of examined exx.). Almost all specimens with hind wings reduced come from islands (where winged specimens are also present): Corfù (1 ex.), Isola del Giglio (3 exx.), Sardegna (3 exx.), Isola di Capraia (1 ex.), Sicilia (4 exx.). Among the specimens studied, two, with reduced wings, come from continental localities (Portugal: "São Martinho" and "Serra de São Mamede").	Usually hind wings reduced, with humeral calli absent (73% of examined exx.).

Dissected specimens: 33 ♂♂; 33 ♀♀.

The author reports also these data from Israel (DFCA) taken from the photos of specimens kindly sent by David Furth. On the labels there is interesting information about host plants. These specimens were not studied by the author, but they seem to have the characteristics (typical coloring) of *L. personatus*:

= *Longitarsus azoricus* Israelson, 1991: 1-4 [synonymized by Gruev & Döberl, 1997: 181]

= *Haltica signata* Reiche et de Saulcy, 1858: 49 [synonymized by Allard, 1860: 116]

= *Teinodactyla biguttata* Fouadras, 1860: 172 [synonymized by Allard, 1860: 116]

#### Distribution

*L. lateripunctatus* is distributed primarily in the western Mediterranean area.

Gruev & Döberl (1997: 181; 2005: 90) report the following regions:

**Europe:** Croatia (Dalmatia: Is. Vis), France (South; incl. Corsica), Greece (incl. Ionian Islands), Italy (South; incl. Sardinia and Sicily), Malta, Portugal, Spain (incl. Balearics).

**Asia:** Cyprus, Greece (Rhodos), Israel.

**North Africa:** Algeria, Morocco, Tunisia.

**Atlantic islands:** Azores (Portugal).

Dissected specimens: 40 ♂♂; 38 ♀♀.

### *Longitarsus monticola* Kutschera 1863 (Fig. 7) and *Longitarsus curtus* (Allard 1860) (Fig. 8)

*L. monticola* was originally described on a few specimens from Styria. Kutschera (1863: 294) reported apterism and colour differences against *L. curtus*. Later on, most authors considered *monticola* as a variety or a subspecies of *curtus*. First Doguet (1984: 302-303; 1994: 289-293) in careful studies of both species reported significant differences in the habitus and shape of genitalia. Döberl (1994: 110; 1995: 40-41) considered these two taxa as valid species reporting diagnostic characters based on a substantial sample.

### Comparative distribution

According to Döberl (1995: 40-41), *L. curtus* is widespread in Europe, while *L. monticola* is mainly distributed in the Alpine Region. According to Doguet (1994: 289-293), *L. curtus* seemingly shows a more western European distribution than *L. monticola*. Later, a map of the

Palaearctic distribution of both species was reported by Warchałowski (1996: 118 Fig. 571).

Although several papers provided more information about their Italian distribution (Leonardi, 1973: 35; Biondi, 1988: 135; 2005; D'Alessandro & Biondi, 2005: 91, 96, 104, 108; D'Alessandro & Biondi, 2007: 465, 471; Baviera & Biondi, 2015: 21; Angelini, 2020: 196), in the author's opinion, the knowledge of their ranges in Italy is still incomplete, also due to the possible confusion between these similar species.

As a result of the study of a large sample, it has been possible to provide both new diagnostic characters and new distributional data and to attempt the production of Italian distribution maps for both species (Fig. 44). As can be seen, *L. curtus* is widespread in Northern Italy and *L. monticola* is occurring almost everywhere in the Peninsula, showing a preference for mountain areas.

All the specimens in MBCA, from Central and Southern Italy, are *L. monticola*. The other specimens (reported as *L. curtus*) indicated in the Checkmap (Biondi, 2005) from Apennines and Southern Italy (and not studied in the present work) in the author's opinion, are also attributable to *L. monticola*.

### Comparative description

A morphological description of both species can be found in Doguet, 1984: 302-303; 1994: 289-293; Döberl, 1995a: 40-41 and Warchałowski, 1995b: 107-110; 1996: 87-89, 157-158. It is worth noting that these species include both forms with complete wings and forms with reduced wings. For discriminant characters see Table 2.

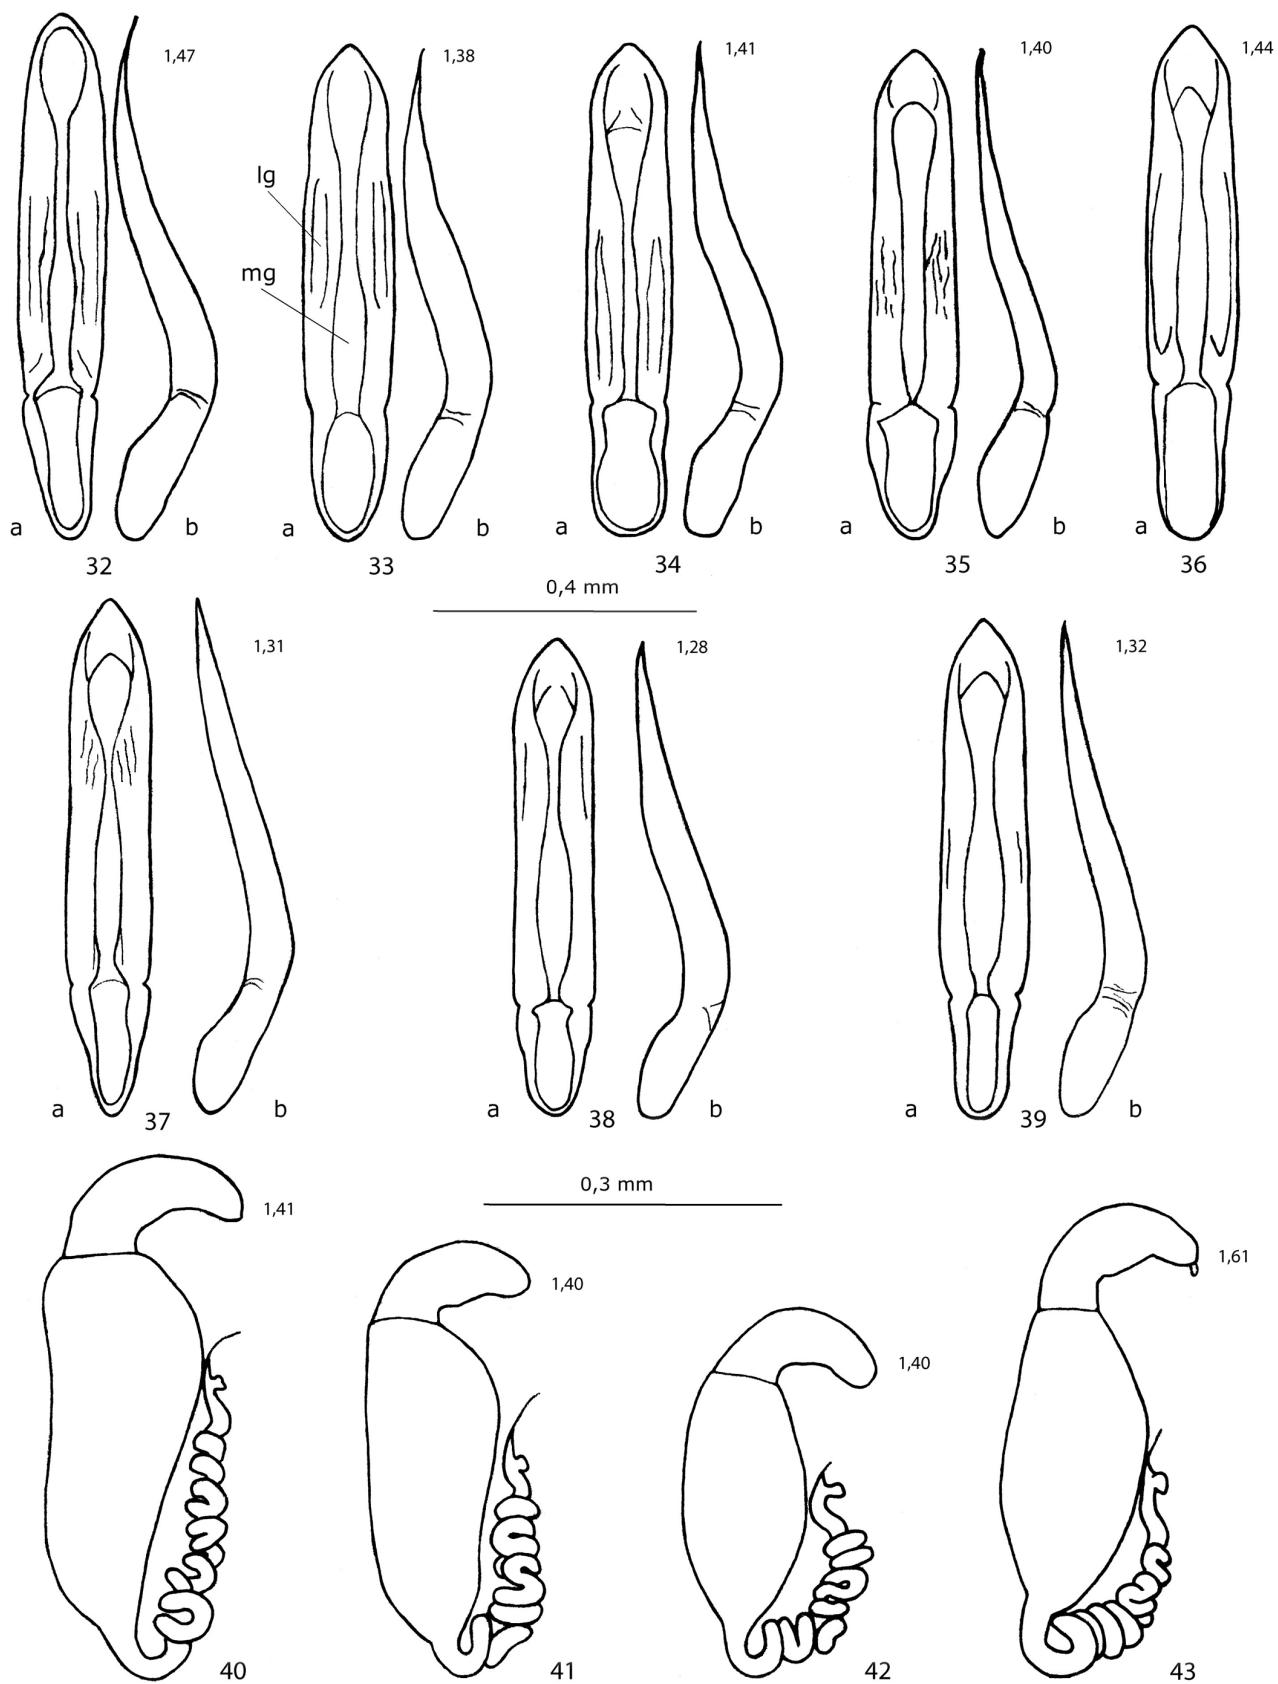

Tab. 2 - Taxonomically discriminant characters of *L. monticola* and *L. curtus*. / Caratteri tassonomici discriminanti in *L. monticola* e *L. curtus*.

Character	<i>L. monticola</i> Kutschera 1863	<i>L. curtus</i> (Allard 1860)
Median lobe of <i>aedeagus</i>	Median lobe of <i>aedeagus</i> (Figs. 32-36) in ventral-dorsal view with straight (slightly sinuous) sides, narrowed apically. Next to median groove (mg, Fig. 33a) a weak and short lateral groove (lg, Fig. 33a), sometimes replaced by longitudinal wrinkles (Fig. 35a). In lateral view distal 2/3s clearly bent, apically shortly sinuate, apical tip usually bent upwards.	Median lobe of <i>aedeagus</i> (Figs. 37-39) in ventral-dorsal view with straight sides, less narrowed apically. Both margins sometimes with weak wrinkles, without grooves. In lateral view almost straight, in a few specimens distal 2/3s slightly bent, but at apex straight or almost so.
<i>Spermatheca</i>	Basal part of <i>spermatheca</i> narrow and gradually widened apically (Figs. 40-41; also: Doguet, 1984: 302-303; Döberl, 1995: 40-41; Warchałowski, 1995a: 107-110). <i>Ductus</i> insertion in basal part located slightly forwards (but a variable character).	Basal part of <i>spermatheca</i> wider in the middle, sometimes sub-cylindric (Figs. 42-43; also: Doguet, 1984: 302-303; Döberl, 1995: 40-41; Warchałowski, 1995a: 107-110). <i>Ductus</i> insertion in basal part often located slightly backwards (but a variable character).
Wings	Hind wings reduced, humeral calli not or weakly developed in most examined specimens (82%).	Hind wings usually well-developed, humeral calli evident in most examined specimens (62%). In the sample, among the winged specimens, females are the majority (67%) while among the reduced wings specimens, males prevail (68%).

### *Longitarsus monticola* Kutschera 1863

*Longitarsus monticola* Kutschera, 1863: 294; VIII, 1864: 44-46; pag. Sp.: 22, 259. Locality indicated: Austria: Styria [= Steiermark] (Maria Zell) [type lost].

Allard, 1866: 136, 204-205 [*Thyamis*]; Redtenbacher, 1874: 506 [*Longitarsus*]; Döberl, 1994: 110, 139 (Figs. 317-319); Doguet, 1994: 272 (Fig. 110d), 292-293, 300 (Fig. 124h) [in the description of the species the author wrote "Remarque: longtemps considérée comme synonyme de *L. curtus*, cette espèce a été récemment réhabilitée (Döberl, *op. cit.*)". In the references Doguet put the paper of Döberl with this indication: "*Longitarsus monticola* Kutschera, 1863 spec. propria (sous presse)"]]; Lucht, 1994: 319; Döberl, 1995a: 40-41 [definition of the Neotype, ♀, NHMW, typ. loc. = *L. curtus* fa. *monticola*, Král, 1945: 32; Mohr, 1962: 71 (Fig. 56), 88-89

= *L. curtus* mut. *monticola*, Kolbe, 1920: 402-403, 404 [referring to *monticola* Kolbe wrote “es ist anscheinend eine werdende neue Art”].

= *L. curtus* var. *monticola*, Weise, 1893: 977; Heikertinger, 1912: 193; Kuhnt, 1913: 885; Porta, 1934: 359; Portevin, 1934: 303; Müller, 1949-1953: 524; Mohr, 1966: 229 (Fig. 51: 18), 230; Warchałowski, 1978: 64 (Figs. 346-347), 66 (Fig. 363), 68; Doguet, 1984: 302-303.

## Distribution

*L. monticola* shows a preference for mountain areas. Gruev & Döberl (1997: 191; 2005: 95) report the following regions:

**Europe:** mountain of Albania (Kelmend, Nikci/Shkenbejt e Jarnes), Austria, Bulgaria, Carpathian Basin, Czechia, France, Germany (South, Middle, West), Hungary, Italy, Poland, Rumania (Transylvania), Slovakia, Slovenia, Switzerland.

**Asia:** Caucasus, Russia, Tajikistan.

According to several papers on the Italian distribution of these two species, *L. monticola* is recorded from sev-

eral localities: Raibl (Leonardi, 1973: 35 Fig. 32); Monte Raut (Carnia), Gressoney (Aosta), Nava (Maritime Alps), Monte Penna (Ligurian Apennines), Gargonzola (Arezzo), Campigna (Romagna), Maddalena Mountains (Potenza), Monti Peloritani, Boschi di Malabotta (Messina), Monti Peloritani and Nebrodi (Biondi, 1988: 135; Baviera & Biondi, 2015: 21); Rocca di Cambio (L’Aquila) (Biondi, 2005: data on CD-Rom); Altopiano delle Rocche (Sirente-Velino mountain area) (D’Alessandro & Biondi, 2005: 91, 96, 104, 108; D’Alessandro & Biondi, 2007: 465, 471); Central Lucan Apennines (Angelini, 2020: 196).

### *Longitarsus curtus* (Allard 1860)

*Teinodactyla curta* Allard, 1860, 8: 137, 143, 832 Loc. typ.: France: Paris.

Kutschera, 1863: 294; 1864: 41-43; Allard, 1866: 135, 242-243 [Thyamis]; Bedel, 1892: 306; Portevin, 1934:

303; Redtenbacher, 1874: 507 [*Longitarsus*]; Weise, 1893: 977; Heikertinger, 1912: 193; Kuhnt, 1913: 885; Heikertinger, 1930: 1326; Porta, 1934: 358; Csiki & Heikertinger, 1940: 118; Mequignon, 1948: 80 [var. *ciliifer* as in Löbl & Smetana, 2010: 524]; Müller, 1949-1953: 514 (Fig. 15), 524, 532; Kaszab, 1962: 311 [ab. *Lichtneckerti*, unavailable name (ICZN 1999, Art. 45.6.2)]; Mohr, 1962: 88-89; Mohr, 1966: 230; Warchałowski, 1978: 68; Doguet, 1984: 302-303 [definition of the Lectotype (typ. loc.: Retz) and Paralectotype (typ. loc.: Paris)]; Bourdonné & Doguet, 1986: 21; Gruev, 1990: 325; Döberl, 1994: 110, 137 (Figs. 314-316); Doguet, 1994: 272 (Fig. 110c), 289-292; 300 (Fig. 124g); Döberl, 1995a: 40-41; Döberl, 1995b: 53 (“Alle bisher überprüften ‘*curtus*’- Stücke erwiesen sich als *monticola*. Das Vorkommen in der Schweiz muß neu bestätigt werden”); Warchałowski, 1995a: 180 (Figs. 722-723), 183 (Fig. 748), 229-231 (Fig. 936); Warchałowski, 1995b: 107-110; Rozner, 1996: 255; Vig, 1996: 123; Warchałowski, 1996: 76 (Figs. 357-358), 79 (Fig. 383), 87-89, 118 (Fig. 571); Gruev & Döberl, 1997: 161-162; Vig, 1997: 195; Fritzlar, 1998: 203; Gruev & Tomov, 1998: 90; Fritzlar, 1999: 75; Baselga & Novoa, 2000: 18; Bezděk & Zúber, 2001: 149; Geiser, 2001: 465; Kapp, 2001: 63, 506; Vig, 2002: 119-120; Brelih *et al.*, 2003: 100; Fritzlar, 2003: 129; Warchałowski, 2003: 445; Geiser, 2004: 19; Biondi, 2005: data on CD-Rom; Fritzlar, 2005: 232, 238-239; Gruev & Döberl, 2005: 82; Čížek, 2006: 25, 27 (Fig. 77); Fritzlar, 2009: 193.

= *Thyamis liliputana* Allard, 1866: 138, 180-181; Bedel, 1889-1901: 191, 306; Heikertinger, 1930: 1326 [*Longitarsus*] [synonymized by Heikertinger, 1930: 1326]

= ?*Thyamis moscovita* Allard, 1866: 135, 247 [synonymized by Heikertinger, 1930: 1326]

= *Thyamis papaveris* Allard, 1866: 133, 226-227; Bedel, 1889-1901: 191, 306 [synonymized by Bedel, 1892: 306]

= *Teinodactyla pratensis* Allard, 1860: 137, 832 (*pratensis* auct. nec Panzer) [synonymized by Allard, 1860: 832: “J’ai donné à tort le nom de *Teinodactyla pratensis* à l’espèce que j’ai décrite à la page 137 n° 84; il faut lui substituer celui de *Teinodactyla curta* Allard”]

= *Thyamis subquadrata* Allard, 1866: 138, 246 [synonymized by Döberl in Löbl & Smetana, 2010: 524]

= *Thyamis vidua* Allard, 1866: 139, 172-173; Leesberg 1882: 160, 171 [*Longitarsus*]; Bedel, 1892: 306 [synonymized by Bedel, 1892: 306]

### Distribution

*L. curtus* is widespread in Europe.

Gruev & Döberl (1997: 161-162; 2005: 82) report the following regions:

**Europe:** Albania, Austria, Belgium, Bosnia-Herzegovina, Bulgaria, Byelorussia, Carpathian Basin, Croatia (included Adriatic islands), Czechia, Denmark, United Kingdom, Isle of Man, Estonia, Finland, France (also Corsica and East), Germany, Greece (Ionian Islands), Hungary, Ireland, Italy (including Sicily), Latvia, Lithuania, Luxembourg, Montenegro, Netherlands, Poland, Rumania, Russia (incl. Karelia), Serbia, Slovakia, Slovenia, Spain, Sweden, ?Switzerland (Döberl, 1995b: 53), Ukraine.

**Asia:** Afghanistan, Caucasus, Daghestan, Russia (Transbaikalia: Buriatia), Tajikistan, Turkestan.

Dissected specimens: 44 ♂♂; 50 ♀♀.

## Acknowledgments

I am very grateful to the following friends and colleagues: Carlo Leonardi (Museo Civico di Storia Naturale di Milano), for his support, suggestions and criticism during the draft of the text and for his precious check of my drawings; Gianfranco Liberti (Uboldo) for his important critical review of the manuscript, his suggestions and help in improving my English text; David Furth (Department of Entomology, Smithsonian Institution, Washington, DC), for his critical review of my manuscript, his interesting suggestions, the sending of *L. personatus* specimen photographs from Israel and his careful check of the English text; Stefano Zoia (Milano) who, with his usual competence and availability, made the photographs; Lutz Behne (Senckenberg Deutsches Entomologisches Institut, Müncheberg), for his kind permission to publish the photograph of the paralectotypes of *L. aphthonoides*; Maurizio Biondi (Università degli Studi dell'Aquila), for his suggestions and for the loan of very interesting specimens; Claudio Pagliarin (Museo di Storia Naturale di Milano) who, with his patience and graphic skills, helped me to improve the drawings and the distribution maps; Maria Chiara Sibille (Ente di gestione delle aree protette del Ticino e del Lago Maggiore) for her assistance in the field; Rita Mascolo and Enrico Muzio (Museo di Storia Naturale di Milano) for their help in digging out overlooked references hidden on the library shelves.

I also wish to thank the following people for the loan of specimens and for their friendly, professional help: Martin Albrecht (Schüpfen), Michael Balke (Zoologische Staatssammlung, München), Ditta Amran Balke (Zoologische Staatssammlung, München), Maxwell Barclay

(Natural History Museum, London), Mauro Daccordi (Museo Civico di Storia Naturale, Verona), Frank Fritzlar (Jena), Michael Geiser (Natural History Museum, London), Christoph Germann (Naturistorische Museum, Basel), Pascale Hutter (Basel), Bernd Jaeger (Museum für Naturkunde, Berlin), Leonardo Latella (Museo Civico di Storia Naturale, Verona), Otto Merkl (Hungarian Natural History Museum, Budapest), Fernando Montemurro (Taranto), Roberto Poggi (Museo Civico di Storia Naturale "Giacomo Doria", Genova), Fabrizio Rigato (Museo di Storia Naturale di Milano).
